

# Simplified Involuntary Reroute Settlement

## *Settle involuntary reroute tickets and FIMs in one step*

### **What is Simplified Involuntary Reroute Settlement?**

It is a multilateral agreement among airlines, managed by ACH, for using one set of rates each month to settle involuntarily rerouted tickets or FIMs without having to prorate them. This thirty-year proven method was automated six years ago for ACH member airlines, and is now open for worldwide application. This tool is one of the AIA Services offerings that help you make your passenger interline billing easier and more accurate.

### **How does it work?**

Each month, ATPCO filters participating airlines' daily sales files to remove inappropriate transactions. Accelya samples one percent of this data and determines coupon values using MPA Neutral Fare Proration. These prorate values are divided by IATA weighted mileage factors to determine the settlement rates for ten global regions. ACH communicates the rates monthly to participants, and historical rates are available online. The settlement rates are applied to the IATA weighted mileage factor of the involuntary reroute coupon or FIM to determine its settlement value.

### **Is it available now?**

The AIA Neutral Fare Prorate engine was enhanced in June 2014 to apply these rates to sales transactions. Robust filters allow you to identify specific transactions for processing by AIA.

### **How can I join?**

Simply execute the multilateral agreement with ACH and choose the other signatories with whom you will concur. We recommend that you allow your sales data from ATPCO's Sales Data Exchange to be used, at no cost, for compiling the monthly percentage rates. The annual fee, which will be waived until June 2015, is USD 1500.

### **How it helps**

- Minimize or eliminate up to half of your rejections and correspondence, improving your productivity and reducing your SIS fees
- Recognize your revenue for complex involuntary reroute transactions accurately and without delay
- Avoid costly adjustments to revenue
